

LISTING OF THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application:

Claims 1-7 (Canceled)

Claim 8 (Previously Presented)

A component-mounting apparatus comprising:
a holding device for holding a component while moving horizontally; and
a positioning device having a sloped portion for engaging and positioning the component held by the holding device when the holding device brings the component into contact with the sloped portion; wherein
the positioning device comprises a first rotatable roller member having a sloped side surface with which the component comes into contact;
the horizontal movement speed of the holding device substantially agrees with the horizontal component of the peripheral velocity of the first roller member, with which the component comes into contact; and
wherein the first roller member has a first rotating shaft extending in a direction substantially perpendicular to the horizontal movement direction of the holding device.

Claim 9 (Previously Presented)

The component-mounting apparatus according to claim 8, further comprising a control device for controlling at least one of the holding device and the first rotating shaft,
wherein the control unit controls at least either the holding device or the first rotating shaft so as to satisfy the following equation:

$$V = 2\pi AN$$

wherein V is the horizontal movement speed of the holding device; N is the number of revolutions of the first roller member; and A is the distance from the center of rotation of the first roller member to the conveying line of the holding means.

Claims 10-11 (Canceled)

Claim 12 (Currently Amended)

The component-mounting apparatus according to ~~any one of Claims 1 and~~ claim 8, further comprising an applying device for applying a paste material to the component, the applying device being disposed downstream of the first roller member in the movement direction of the component.

Claim 13 (Original)

The component-mounting apparatus according to Claim 12, wherein
the applying device comprises a second rotatable roller member having a circumferential surface provided with the paste material to apply the paste material to the component when the component comes into contact with the circumferential surface; and
the horizontal movement speed of the holding device substantially agrees with the horizontal component of the peripheral velocity of the second roller member, with which the component comes into contact.

Claim 14 (Original)

The component-mounting apparatus according to Claim 13, wherein the second roller member has a second rotating shaft extending in a direction substantially perpendicular to the horizontal movement direction of the holding device.

Claims 15-16 (Canceled)
